

Condition monitoring solutions for the pulp and paper industry

The opportunity

Pulp and paper, together with the printing press invented in the 15th century, has greatly catalyzed man's innovation and progress by sharing knowledge far and wide. The manufacture of paper is itself a remarkable innovation, combining highly sophisticated production processes with the art of papermaking. The result? A multitude of paper-based products used for creativity, communication, packaging and beyond.

Today, although overall pulp and paper growth rates are slowing, certain categories of paper are in high demand, creating pockets of opportunity and profit potential for those manufacturers who remain nimble and current.

The challenge

Concurrent with that opportunity, pulp and paper mills are facing rising lumber, process chemical and energy costs and global competition that challenges price points. As cost increases erode profitability, leading pulp and paper manufacturers have found ways to both maximize asset availability and output while optimizing processes to reduce maintenance costs.

In pulp and paper operations, reactive, time-based maintenance approaches create higher order maintenance costs and increased risk levels. Thus, maintenance is an underleveraged opportunity, ripe for operational optimization with proactive maintenance via condition monitoring solutions.

The solution

Proactive maintenance via condition monitoring solutions enables pulp and paper operations to use data-driven insights to manage operations and reach the proper balance point across competing priorities:

Outcome

Maximize 'smart' uptime

Minimize downtime

Ensuring/enhancing safety

Meeting regulatory compliance

Minimizing maintenance costs

Enabler

Understanding asset health, asset life

Preventing unplanned downtime **before** it occurs

Automating machine monitoring to reduce risk

Tracking key metrics

Repairs made at lowest possible cost (before damage escalates prior to full failure and scheduled during planned outages)

Condition monitoring

Condition monitoring obsoletes reactive, time-based maintenance approaches which are based on calendar intervals or running hours. Time-based approaches are only valid for about 15% of operational assets, and are poor "predictors" of failure for many assets, resulting in two major issues. First, the majority of assets are getting "maintained" when they don't need to be, creating a wasteful, overspend in maintenance. Second, it doesn't prevent full failures and can allow asset issues to escalate to unplanned downtime, causing costs to escalate in kind.

Failure is a process

By contrast, condition monitoring supports a proactive approach, based on the premise that failure is a process, not an event. The Extended P-F curve depicts this concept by delineating a distinct span of time between the potential for failure and functional failure.

Potential for failure is detected by monitoring asset health by measuring properties, such as, vibration, temperature, efficiency, oil chemistry/particulates, and other physical parameters. Together with tailored algorithms, customized configurations and set points, these parameters can identify both root cause failure mechanisms, in progress as well as irreversible physical damage that has already started. As a result, failure can be averted, sound data-driven decisions made and repairs scheduled at the most advantageous times and lowest possible costs.

The Extended P-F Curve

Consequence-based technology implementation

In terms of proactive condition monitoring, all assets are not created equal. Each asset has its own warning duration before failure and asset failure can also result in varying consequences, described below as Important, Essential, and Critical. For critical assets with shorter warning durations, operators monitor their performance with a continuous, on-line condition monitoring system. For essential assets with a longer warning duration, periodic on-line systems work well. Lastly, important assets that also have a longer warning duration are typically monitored with walk-around portable devices. Matching asset characteristics and impact on production is important for aligning the proper condition monitoring approach and achieving production optimization.

Condition monitoring applications in pulp and paper

Additionally, we monitor the following assets throughout the process.

-  Pumps ◆
-  Motors ◆
-  Compressors ●

Continuous On Line Monitoring

-  Orbit 60
-  ADAPT 3701/40
-  2300 Series
-  AnomAlert

Scanning On Line Monitoring

-  vbOnline Pro
-  Ranger Pro

Off Line Route Based Portable Data Collection

-  SCOUT 100
-  VBx series
-  COMMTEST/SCOUT 220/240

SCOUT 100, VBx series and COMMTEST/SCOUT 220/240

Bently Nevada

Unreliable and underperforming assets have enormous consequences. Industry studies show that the average facility spends approximately 5% of its Replacement Asset Value (RAV) on maintenance each year. In comparison, best performers spend 60% less—just 2% of RAV—while enjoying better uptime, efficiency, and profitability. It's not simply about spending less on maintenance, it's about working differently—and smarter—to achieve more reliable pulp and paper operations.

Bently Nevada helps customers get started.

Bently Nevada service menu

Key benefits

Implementation services

Be proactive, get it right the first time

- Ensure your assets are protected and monitored when you're ready to startup
- Avoid costly delays and rework
- Use one source to design, plan, manage, and execute the installation
- Prevent startup trips due to improper installation and configuration

Up to \$1M/day
Cost mitigation from lost production, secondary process & equipment damage

100%
Service work guarantee
1 year warranty standard on all service work

Proactive support

Keep your system healthy and optimized

- Prevent instrumentation related false trips
- Avert and minimize potential data loss events
- Keep up to date and compliant with the best technologies available
- Access the expert support you need when you need it most

80%
Machinery alarms and events due to instrumentation

>90%
Typical reduction in non-actionable alarms and events

Asset health and consulting

Generate actionable insights you can trust

- Understand your asset health to optimize outage and maintenance planning
- Plug in to our global network of machinery experts with remote monitoring
- Get professional OEM agnostic machinery diagnostics when and where needed
- Customize analytic development and tuning to pinpoint specific conditions

100% ROI
Savings from a single machine often results in full monitoring contract payback and more

5-10X
Cost reduction for well planned maintenance outage vs. unplanned reactive outage

Cybersecurity¹

Stay ahead of evolving cyber threats

- Ensure your system is up to date and protected as threats continually evolve
- Identify and mitigate cybersecurity risks to your operation
- Keep your system both secure and accessible with advanced security technologies and architectures by leveraging data diodes and database replication

29%
Patch management can reduce your attack surface up to 29%

243 days
Average time lapsed before detection that a system is compromised

Training and education

Augment critical skills that amplify your machinery management capabilities

- Enable your personnel to operate and maintain your monitoring and protection system
- Enable your operation to maximize the value of your system by leveraging expert product and application training and knowledge

400+
Customer courses delivered each year in 10 languages and to over 45 global locations

Why partner with Bently Nevada?

We are a trusted partner with a proven track record and deep expertise. For six decades the Bently Nevada experts and offerings have supported the most demanding proactive maintenance applications across multiple industries. Our quantified results speak volumes, and we create significant benefits for our customers. Even as we protect and monitor your machinery, we constantly strive to refine and improve our offerings—and help enable your success.

We design and deliver integrated solutions for all of your monitoring needs—including sensors, distributed and rack-based monitors, software, and supporting services—with the following goals:

- Increased availability and production
- Lowered maintenance costs

- Reduced risk in safety, environmental, and asset performance

Quantifiable, proven results:

- **60+ years** of innovation in asset protection, condition monitoring
- **240+ international patents**, including 150+ U.S. patents
- **350+ international patents pending**, including 95+ U.S. patents
- **8+ million** sensor monitoring points
- **1,600+ System 1 software** users worldwide
- **Extensive services support** provided globally

You can rely on us

For more than 60 years, we've been supplying condition monitoring solutions to machinery-intensive industries. We also bring two decades of experience implementing reliability improvement projects. Customers turn to us for a simple reason: lasting value. Our solutions demonstrate their worth, day in and day out, and often result in expanded implementations because of their proven ROI. We combine the highest quality products and responsive customer support with a service team that takes the time to understand the uniqueness of your plant, your personnel, and your goals.

Our products can be found in many of the world's mining plants. Today, many of those same plants are turning to Bently Nevada for a more comprehensive solution to their needs, moving beyond just machinery protection instrumentation on a few assets to plant-wide strategies and systems for improved environmental compliance, safety, asset production, quality and reduced operation and maintenance costs.
